The dilemma

Many hospitals and healthcare providers are delaying elective surgeries, screenings, and other procedures, which are considered not urgent or not immediately life-threatening. These tough decisions are being made on a case-by-case basis to protect people from the higher risk of infection in healthcare facilities, and to make sure healthcare providers have the resources they need to treat people who become seriously ill from COVID-19

I have cancer
now what ?

Just give me some answers

I'm concerned!

I have recently had cancer diagnosed, and my surgeon has advised that my surgery alongside other elective surgeries might be postponed.

What should I do?

Do I wait, hoping that my cancer will not metastasise?

Do I look for a suitable alternative? In such a time of social upheaval and stress on my family, we really don't need this!

The new face of surgical suites

The answer is within reach

The good news is that there is a treatment that is available now, can be performed in wide range of suitable environments to keep you safe from the risk of COVID and can be provided now. The key to providing a safe, accessible and effective treatment is Echolaser™

ELESTA
Beyond Laser

So tell me about Echolaser™

A simple procedure that effectively treats both benign and malignant lesions, Echolaser™ delivers outstanding results with negligible patient risks. This is a method, now used internationally, that well-suits most patient's needs, has been demonstrated to be clinically safe and efficacious in benign pathologies (e.g. thyroid nodules, prostate hyperplasia) and might prove useful for some types of cancers (e.g. focal therapy of prostate cancer).

The procedure has been performed in hospitals internationally now for over 10 years, and the very few complications to date have been small and temporary in nature. It has proven to be a reliable method that patients tolerate well, and with lasting effects. Surgeons can use this treatment also as a stop-gap method allowing them to be re-examined in a timely manner and surgery performed (if needed) after this pandemic has passed. In fact, this procedure is repeatable and does not impair other therapeutic approaches (e.g. surgery, radiotherapy etc.) once accurate and definitive diagnosis has been done.

What's needed ?

This distinctive and improved technique is available for you and your patients now.

While other treatments need operating rooms, access to expensive spaces and materials that are currently reserved for sterile procedures, Echolaser™ has very simple demands.

Access to **ultrasound** equipment

Provision of suitably qualified staff, selected from **specialists** such as a Urologist, Radiologist, Surgeon, Gynaecologist etc. Anyone familiar with performing ultrasound guided interventions will easily perform this intuitive treatment process.

Provision of **technical & nursing** support

Simple **cleaning solutions** that are suitable and effective for maintaining equipment and surface integrity between cases

An **examination room** with suitable privacy: this can be as simple as a medical practice, a private hospital room, a dedicated office space

Well tolerated

Lasting results

Rapid

Cost-effective

Caring for the patient

Making the experience for the patient is paramount. The “micro-invasive” technique has vast benefits to achieve this. The minimal discomfort is controlled by the priority use of local-anaesthetic and mild sedation, in conjunction with rapid treatment times.

This makes light work of already difficult times for patients with onerous disease

The evidence

A wide range of documents outlining the clinical efficacy of the method are available upon request. Our clinical team is available for a in depth discussion regarding any of your enquiries or concerns. Contact us and we will arrange a video-conference.
